

Snapper Mineral Sands Project

Approvals for the Snapper Mineral Sands Project near Pooncarie, NSW established environmental management obligations for operator, Bemax Resources.

We were engaged to implement recommendations arising out of the Microchiropteran Bat Management Plan for clearing of habitat trees.

The management plan required searches for habitat trees; assessment to determine occupancy by bats (in particular, threatened species); and then oversight of the night-time clearing program. Where tree hollows could be salvaged, we advised on their placement in areas outside of the clearing zone.

We managed this clearing program for several years, facilitating efficient project expansion.
